

Build Preview

Seeing what your customization does before it does it

Bell Canada added a Java OCI artifact to a Python customization

Java's env vars silently merged into the final image.
Nobody told them this would happen.

Two paths from Review

Skip preview

"Build customization" commits directly.
For repeat configs or simple setups.

See it first

"Preview build" advances to step 5.
For first-time configs, complex artifacts, or
upstream changes.

Origin labels match importance

Customization

User set this value explicitly

Plain text

Tag definition

Set by the image maintainer

Plain text

Inherited from artifact

User should be aware this exists

Blue badge

Override

Artifact value was suppressed

Amber badge

Expected origins recede. Surprising origins pop.

Modified vs. unmodified

Modified sections

Open by default. Fields the customization changed.

Summary: 6 set, 4 overrides, 9 inherited

Unmodified sections

Collapsed with count badge. Fields the user didn't touch, but that exist in the resolved image.

Not hidden, just quiet.

The ask

Should the preview organize by field type, or by surprise level?

Is the list scannable?

Should it lead with a summary before showing the full list?
